Continued West Nile Virus Activity in Shasta County

Two more West Nile virus (WNv) positive mosquito samples have been discovered in Shasta County. One of the samples came from a trap located in the Northeast Redding area and the other came from a surveillance trap located in Anderson. “With temperatures continuing to be high, and adult mosquito populations lingering, the risk from West Nile virus remains a concern. We ask that residents continue to take precautions to prevent mosquito bites when enjoying time outside” stated Peter Bonkrude, District Manager of the Shasta Mosquito and Vector Control District. In addition, the District is reminding residents to eliminate any potential mosquito sources on their property to help in the reduction of adult mosquitoes.

West Nile virus continues to be present throughout the state, with positive WNv indicators throughout California counties. Due to this increase in WNv transmission, the District has augmented surveillance and treatment of larval and adult mosquitoes in the affected areas.

The Shasta Mosquito and Vector Control District staff urges residents to take precautions to avoid mosquito bites by implementing the 4 Ds of protection:

- **Drain** any standing water that may produce mosquitoes, this includes flowerpots, old tires, and buckets. Some species of mosquitoes can lay their eggs in very small sources of water, like a bottle cap.
- **Defend** yourself and your home by using an effective insect repellent and making sure screens on doors and windows are in good condition.
- **Dusk** or Dawn, avoid outside activities.
- **Dress** in long sleeves and pants when mosquitoes are active.
